THE PROPAGATION AND DISTRIBUTION OF FOOD FISHES IN 1905.

INTRODUCTION.

The principal function of the Bureau of Fisheries, the maintenance and increase of the available supply of aquatic food products, has its largest fulfilment in the artificial propagation and distribution of fish and eggs. The extensive and depleting commercial fisheries for a number of species and the constantly growing demand for food and game fishes for stocking private lakes and streams have led to such an enlargement of the field of operations that about fifty species are now cultivated, the list including the principal fishes of all parts of the country. Nor is the work confined to the hatching and rearing of fish by artificial methods. A very important feature is the rescue of young fishes from the overflowed lands in the Mississippi Valley, where they would be lost when the waters recede, for the sloughs, cut off from the river, become dry in the heat of summer or freeze in winter. Furthermore, some of the most valuable and far-reaching results have come from the acclimatization of nonindigenous fishes in various waters.

SPECIES CULTIVATED AND DISTRIBUTED.^a

The following species, listed by families, were handled in 1905:

THE CATFISHES (SILURIDÆ):

- * § Spotted cat, blue cat, channel cat (*Ictalurus punctatus*).
- * § Horned pout, bullhead, yellow cat (*Ameiurus nebulosus*).
- * Marbled cat (*Ameiurus nebulosus marmoratus*).
- § Black cat (*Ameiurus melas*).

THE SUCKERS AND BUFFALOFISHES (CATOSTOMIDÆ):

- § Buffalofishes, chiefly *Ictiobus bubalus*.

THE MINNOWS AND CARPS (CYPRINIDÆ):

- † || Carp (*Cyprinus carpio*).
- † || Goldfish (*Carassius auratus*).
- † || Tench (*Tinca tinca*). Cultivated variety, golden tench.
- † || Ide (*Leuciscus idus*). Cultivated variety, golden ide.

THE SHADS AND HERRINGS (CLUPEIDÆ):

- * Shad (*Alosa sapidissima*).

^a The fishes artificially propagated are designated thus, *; those simply collected and distributed, thus, §; those propagated as food for other fishes, thus, †; those propagated for ornamental purposes, thus, ‡; and introduced species, thus, ||.

THE SALMONS, TROUTS, WHITEFISHES, ETC. (SALMONIDÆ):

- * Common whitefish (*Coregonus clupeiformis*).
- * Bluefin whitefish (*Argyrosomus nigripinnis*).
- * Lake herring, cisco (*Argyrosomus arctedii*).
- * Chinook salmon, king salmon, quinnat salmon (*Oncorhynchus tshawytscha*).
- * Silver salmon, coho (*Oncorhynchus kisutch*).
- * Blueback salmon, red-fish, sockeye (*Oncorhynchus nerka*).
- * Humpback salmon (*Oncorhynchus gorbuscha*).
- * Steelhead, hardhead, salmon trout (*Salmo gairdneri*).
- * Rainbow trout (*Salmo irideus*).
- * Atlantic salmon (*Salmo salar*).
- * Landlocked salmon (*Salmo sebago*).
- * Yellowstone Lake trout, cutthroat trout, black-spotted trout (*Salmo lewisi*).
- * Colorado River trout, black-spotted trout (*Salmo pleuriticus*).
- * Arkansas River trout, green-backed trout (*Salmo stomias*).
- * Yellow-finned trout (*Salmo macdonaldi*).
- || * Sea trout, salmon trout (*Salmo trutta*).
- || * Loch Leven trout (*Salmo trutta levenensis*).
- * Lake trout, Mackinaw trout, longe, togue (*Cristivomer namaycush*).
- * Brook trout, speckled trout (*Salvelinus fontinalis*).
- * Golden trout, Sunapee Lake trout (*Salvelinus aureolus*).
- * Canadian red trout (*Salvelinus marstoni*).
- * Hybrid trout (*Salvelinus fontinalis*+*aureolus*).

THE GRAYLINGS (THYMALLIDÆ):

- * Montana grayling (*Thymallus montanus*).

THE PIKES AND PICKERELS (ESOCIDÆ):

- * Pike or pickerel (*Esox lucius*, *Esox reticulatus*).

THE BASSES, SUNFISHES, AND CRAPPIES (CENTRARCHIDÆ):

- * § Crappie (*Pomoxis annularis*).
- * § Strawberry bass, calico bass (*Pomoxis sparoides*).
- * § Rock bass, red-eye, goggle-eye (*Ambloplites rupestris*).
- * § Warmouth, goggle-eye (*Chænobryttus gulosus*).
- * § Small-mouth black bass (*Micropterus dolomieu*).
- * § Large-mouth black bass (*Micropterus salmoides*).
- * § Bluegill sunfish (*Lepomis incisor*).
- § Other sunfishes, chiefly *Eupomotis gibbosus*.

THE PERCHES (PERCIDÆ):

- * § Pike perch, wall-eyed pike, yellow pike, blue pike (*Stizostedion vitreum*).
- * § Yellow perch (*Perca flavescens*).

THE SEA BASSES (SERRANIDÆ):

- * Striped bass, rockfish (*Roccus lineatus*).
- * White perch (*Morone americana*).

THE LABRIDS (LABRIDÆ):

- * Tautog (*Tautoga onitis*).

THE CODS (GADIDÆ):

- * Cod (*Gadus callarias*).
- * Pollock (*Pollachius virens*).

THE FLOUNDERS (PLEURONECTIDÆ):

* Winter flounder, American flatfish (*Pseudopleuronectes americanus*).

CRUSTACEANS:

* American lobster (*Homarus americanus*).

THE OUTPUT.

The output for the year 1905 was over 250,000,000 more than for any previous year in the history of the Bureau. This increase represents in particular a greater production of Pacific salmon, lake trout, pike perch, yellow perch, large-mouth black bass, lake herring, and lobster, and in addition the propagation of the bluefin whitefish for the first time. Cod, whitefish, and all other species cultivated, except the shad, furnished an average yield. The shad output was unusually small, owing, apparently, to the fact that an unusual proportion of the marketed fish were caught in salt or brackish water, but few being left to reach the spawning grounds, where the eggs are obtained for the hatcheries.

A summary of the output for the year 1905 is shown in the following table:

SUMMARY OF DISTRIBUTION OF FISH AND EGGS DURING THE FISCAL YEAR 1905.

Total.....	410,480,175	1,337,371,138	11,623,726	1,759,475,039

In addition to the above the experiment was tried of introducing into Lake Saline, near Palestine, Tex., 1 barrel of reef oysters, 24 blue crabs, and 157 marine fishes, among which 5 species were represented.

THE STATIONS.

Fish-cultural work is at present conducted at 32 stations and numerous substations, the latter being auxiliaries operated only at particular seasons. Some of them are the principal sources of the egg supply in their respective regions; others are important as distributing points. In the following list, which shows the output of the various stations, the character of the work conducted at each is indicated by arbitrary signs, thus: Stations where eggs were hatched during 1905, *; stations used merely as egg-collecting points, §; stations concerned in the work of rescuing fishes from the overflowed lands, †.

^a The State Fish Commission steamer *Illinois* was operated on the Illinois River for the rescue of fishes from the overflowed lands on both sides of the river at points not otherwise covered from Meredosia. The launch *Egret* was used for making collections covering a distance of 10 to 12 miles above and below Meredosia. Meredosia is a station for retaining and distributing fishes thus secured which are not planted in the river.

The following table shows the distribution of fish and eggs by stations. In some instances a portion of the stock of a station was transferred to another station to be hatched or reared and distributed. In such cases the transferred stock is credited in the table to the station from which it was actually distributed. That each station may have due credit for its total product, however, footnotes have been added to explain the transfers.

From Spearfish to Bozeman, 400,000 blackspotted trout eggs.

From Wytheville to other stations, 200,000 rainbow trout eggs.

THE DISTRIBUTION.

The first consideration in the distribution of the product of the hatcheries is to make ample return to the waters from which eggs have been collected. The remainder of the fish are sent to applicants throughout the country for stocking state waters, fishing preserves, private ponds and streams, etc., and are delivered free of charge to the applicant, at the railroad station nearest the point of deposit. In 1905, 4,908 such applications were received, an increase of 15 per cent over the previous year, and a demand so far in excess of the resources of the Bureau that many applications had to be continued on file, to be filled from the succeeding year's stock. The output especially of black bass (both large-mouth and small-mouth), crappie, and the catfishes was inadequate, although many more of these fishes were produced in 1905 than in any previous year.

Fishes are distributed at various stages of development, according to the species, the numbers in the hatcheries, and the facilities for rearing. The commercial fishes, such as the shad, whitefish, lake trout, pike perch, cod, etc., which are hatched in lots of many million, are necessarily planted as fry; it is customary to distribute them just before the umbilical sac is completely absorbed. Atlantic salmon, landlocked salmon, and various species of trout in such numbers as the hatchery facilities permit are reared to fingerlings from 1 to 6 inches in length; the balance are distributed as fry. The basses and sunfishes reared at fish-cultural stations are distributed from the time the young rise from the spawning beds until they have reached such size as makes it impracticable to feed them in the hatcheries; the last lots distributed are usually of fish 3 to 5 inches in length. The numerous kinds of fishes collected in overflowed lands—basses, crappie, sunfishes, pike and pickerel, catfishes, yellow perch, buffalofish, and others—are 2 to 6 inches in length when taken and distributed. Eggs are distributed only to state hatcheries or to applicants who have facilities for hatching them.

The difference in methods of hatching applicable to the different species is a determining factor in the supply of particular fishes available for distribution, and consequently of the number allotted to individual applicants. The area and character of the water to be stocked must likewise be considered, for the same water area which would receive a million pike perch fry would perhaps be assigned no more than 200 or 300 black bass 3 or 4 inches long, or four to eight times that many if the bass were planted as fry. The explanation is in the fact that pike perch can be propagated by the hundred million, while black bass, hatched by other methods or collected from overflowed lands, can be produced only in comparatively small numbers. The Bureau does not attempt to assign any applicant more

than a liberal brood stock of the basses or sunfishes. With brook trout, which are distributed both as fry and fingerlings, assignments of fry are twenty-five to fifty times larger than assignments of fingerlings 3 to 4 inches long.

The following tabulation shows, by species and waters stocked, all distributions of fish and eggs during the year ended June 30, 1905. The waters are grouped according to states and localities, which are arranged in alphabetical order, with the exception of assignments to foreign governments. A total of 1,756,000 eggs was shipped to the governments of Argentina and New Zealand.
